...

Physiology. The retching phase is characterized by a series of violent spasmodic abdomino-thoracic contractions with the glottis closed. During this time, the inspiratory (inhalatory) movements of the chest wall and diaphragm are opposed by the expiratory contractions of the abdominal musculature. At the same time, movements of the stomach and its contents take place.

The diad is a structure in the cardiac myocyte located at the sarcomere Z-line. It is composed of a single t-tubule paired with a terminal cisterna of the sarcoplasmic reticulum. The diad plays an important role in excitation-contraction coupling by juxtaposing an inlet for the action potential near a source of  $Ca^{2+}$  ions. This way, the wave of depolarization can be coupled to calcium-mediated ...

The textbook, Respiratory Physiology (West, 2000), suggests that the lower 10% of the lungs transport more than 40 ml of

oxygen per minute, while the upper 10% of the lungs transport less than 6 ml of oxygen per minute. Hence, the lower parts of the lungs are about 6-7 times more effective in oxygen transport than the top of the lungs due to ...

Difference Between Adrenaline and Cortisol Adrenaline Vs Cortisol Adrenaline and cortisol have been confused with each other most probably because they come from one source “ the adrenal glands. Immersing further deep into these two hormones would yield various differences. Adrenaline is the common or layman’s term for epinephrine. As mentioned, it is a hormone but at the same time, [...]

La urobilina es un producto del metabolismo de la bilirrubina, [1] que a su vez se produce por degradación de la hemoglobina, la molécula que transporta el oxígeno en el interior de los glóbulos rojos. La bilirrubina proviene de la ruptura del grupo hemo de los glóbulos rojos degradados. La bilirrubina en su forma simple (no conjugada) no es soluble, por lo que en la sangre se asocia a una

Calcolo del volume sistolico. Il valore si ottiene sottraendo il volume telesistolico (end-systolic volume, ESV), dal volume telediastolico (end-diastolic volume, EDV) del ventricolo esaminato. = In un uomo sano di 70 kg il volume telediastolico è circa 120 mL e il volume telesistolico è circa 50 mL, con una differenza di 70 mL che corrisponde al volume sistolico.

## **Volume sistolico - Wikipedia**

Minutni volumen srca (oznaka MVS) je volumen krvi, ki jo prekat prečrpa v eni minuti. Podaja se v različnih enotah, na primer dm<sup>3</sup>/min (1 dm<sup>3</sup> je enako 1000 cm<sup>3</sup> ali 1 litru). Povprečen minutni volumen srca v mirovanju je 5,6 L/min pri moškem in 4,9 L/min pri ženski.

Hundreds of proteins are dissolved in the plasma. By measuring the concentration of these proteins, the clinician can obtain information regarding disease states in different organ systems. The measurement of protein is done on serum, which is the fluid that remains after plasma has clotted, thus removing fibrinogen and most of the clotting factors. Total protein content provides some ...
