Curved decks can be guided either radially from a fixed point or tangentially to the radius of curvature. If the deck is guided radially, then the accuracy of the geometry becomes critical for the bearings furthest from the fixed point.. For structures with a constant curvature it is best to align the bearings tangentially to effectively guide the deck around the curve as it expands and contracts.

Fixed point iteration A-77 Solution to Guided Project 9: Fixed point iteration 1. $x = -2$, 1 are the two fixed points of the function $f(x) = 2 - x^2$. 2. a. Starting with $x_1 = .5$, the first 10 iterations show that the values are getting closer to each other: 32 65 b. A good estimate of the fixed point for $f(x) = \cos(x)$ would be $x = .7400$. c.

Fixed points for the recursion thus would satisfy a $D_1 4 a C 3 4$. Solve this equation for a. a $D 1 4 a C 3 4 3 4 a D 3 4 a D_1$ We find that a D_1 . In the above example this fixed point is also the limiting value of the sequence. This will not always be the case: A fixed point is only a candidate for a limit;
